EXPERIMENT – 05

Dashboard for Campus Event & Participation Management System

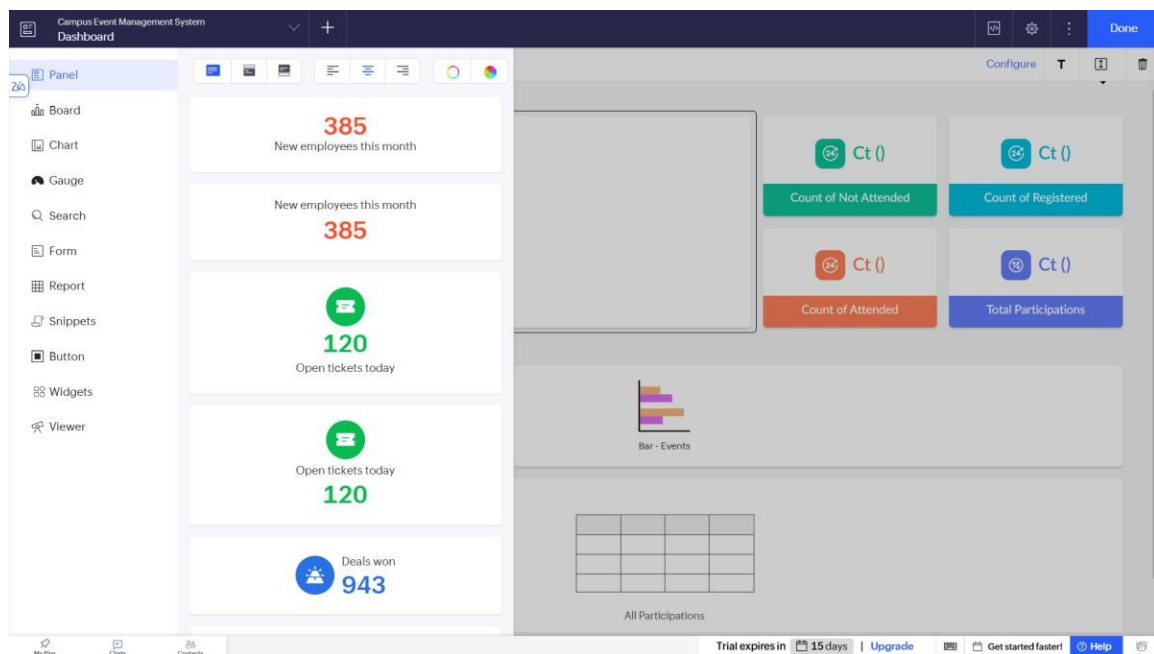

Aim:

To design and build an interactive Dashboard for the Campus Event & Participation Management System using visual builders to aggregate and display key metrics, charts, and embedded reports.

Procedure:

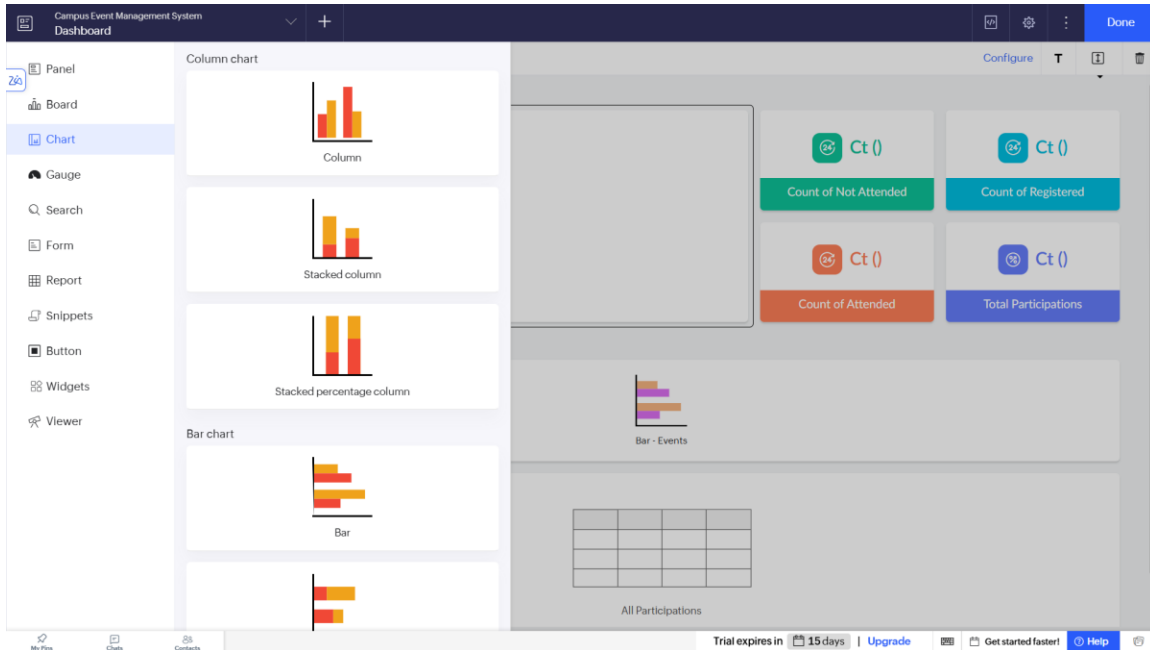

1. Adding KPI Panels:

Open the Dashboard builder and navigate to the "Panel" menu. Drag and drop metric widgets to the canvas to display live counts for Total Participations, Count of Attended, Count of Not Attended, and Count of Registered participants.

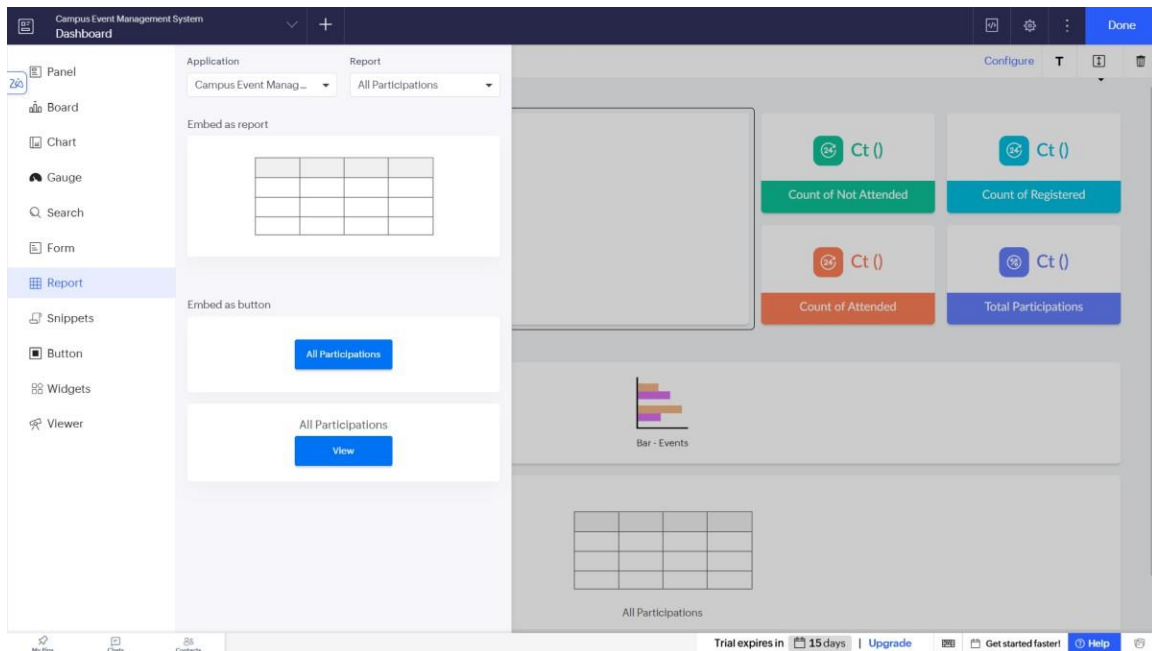

2. Configuring Charts:

Access the "Chart" menu to insert visual analytics. Configure a Scatter chart to analyze Registered Participants versus Maximum Participants, and add a Bar chart to visualize the number of Registered Participants by Event Type.

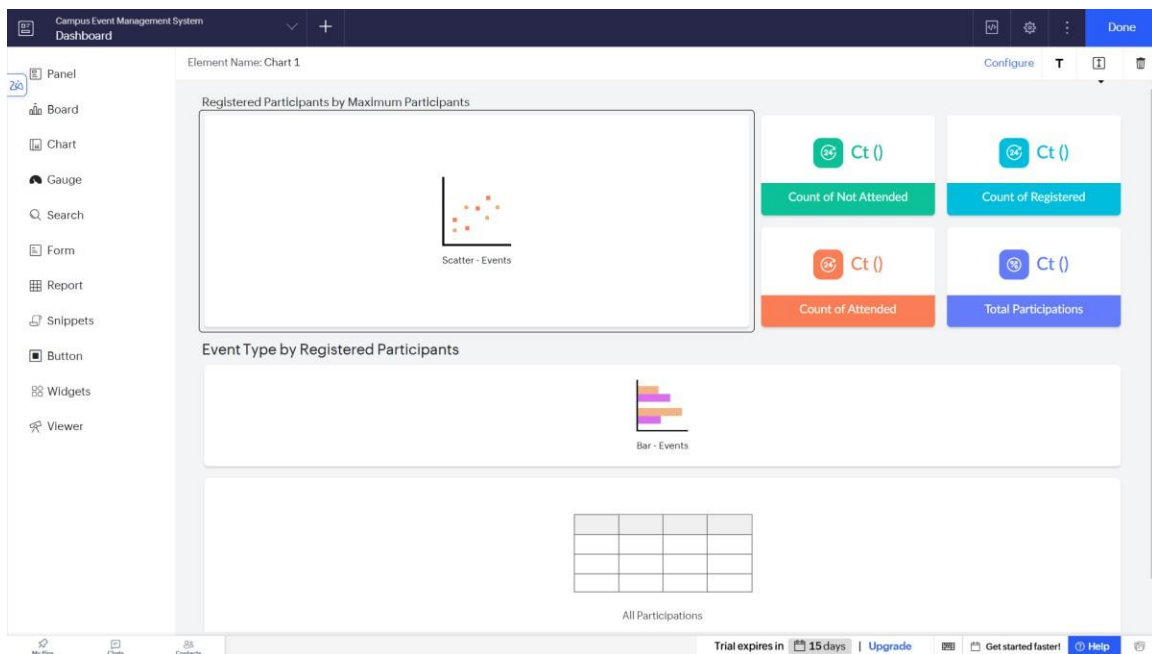

3. Embedding Data Reports:

Navigate to the "Report" tab in the builder menu. Select the "All Participations" application view and embed it directly into the dashboard as a tabular report for quick access to detailed records.

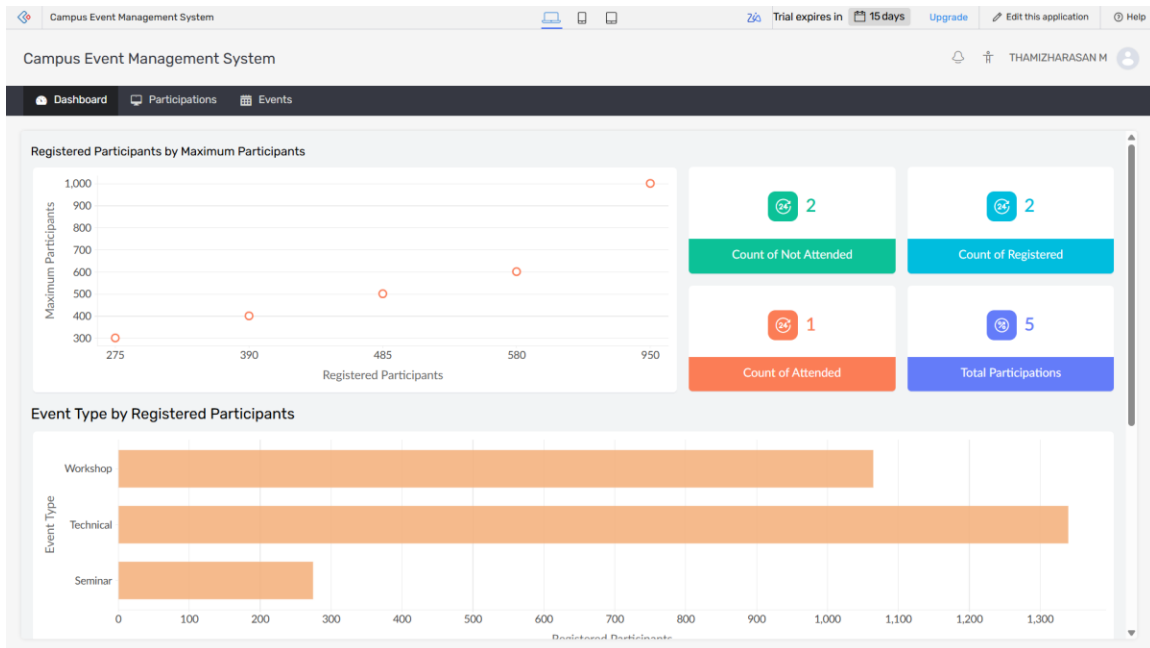

4. Arranging the Builder Canvas:

Organize the layout of the dashboard components within the builder canvas. Ensure the charts, KPI panels, and the embedded report are sized appropriately and arranged logically for optimal user experience.

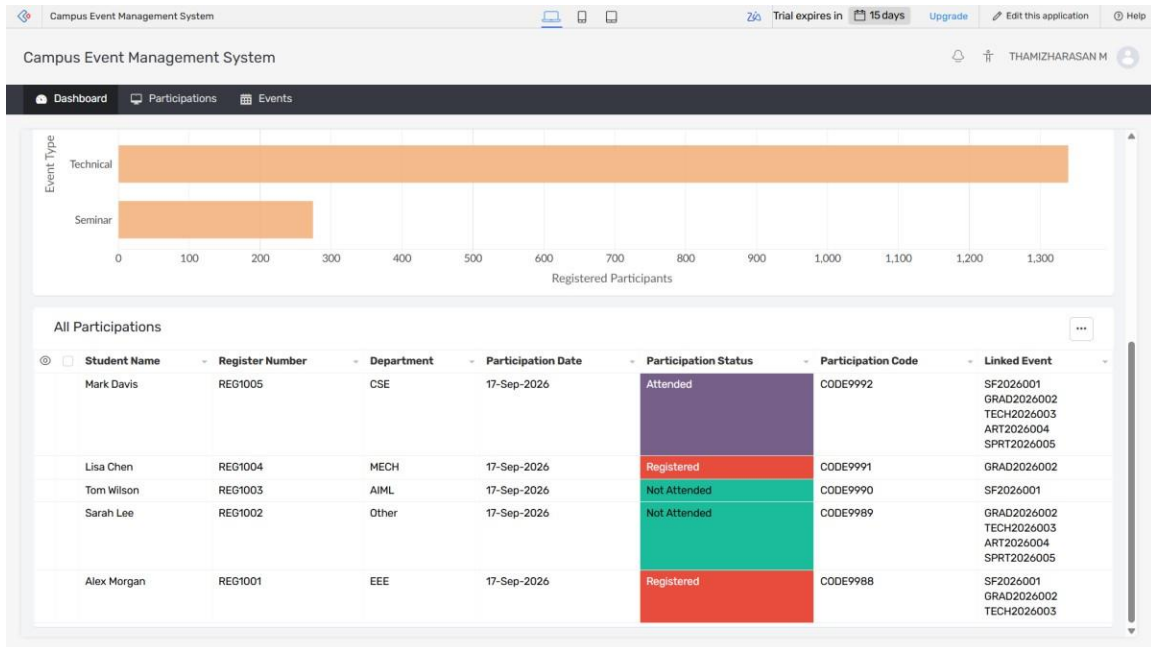

5. Visualizing the Live Dashboard (Top Section):

Save and access the live application dashboard. Verify that the top section accurately displays the dynamic scatter plot, the event type bar chart, and the color-coded KPI metric panels.

6. Visualizing the Live Dashboard (Bottom Section):

Scroll down the live dashboard to ensure the embedded "All Participations" list view renders correctly, showing real-time participant statuses and linked events.

Conclusion:

An interactive and comprehensive dashboard was successfully designed and deployed. It effectively consolidates essential event data and participant metrics into a single graphical interface, providing real-time data visualization and enhancing event monitoring capabilities.
